PRODUCT AVAILABLE IN THE FOLLOWING VARIANTS:

COLONY SIZE QUEEN WITH 15-25 WORKERS

### ITEM DESCRIPTION

**Name:** Chthonolasius

**Difficulty level:** Medium

**Sizes:** 4-5mm (worker), 6-7mm (queen)

**Humidity:** Approx. 50%

**Temperature:** 20-28 ° C

**Diet:** Protein food (e.g. mealworm) + Carbohydrates (e.g. diluted honey)

The queens of this species are so-called with parasites, after the swarm (mating flight), the queen flies to the ground where she looks for the *Lasius niger* colony (most often), waits at the exit and as soon as the opportunity arises, she kills one of the outgoing workers and then uses her as a shield entering the nest (after contact with *Chthonolasius* workers smell the smell of their sister), then moves to the chamber with pupae and takes the smell of the colony, when she feels sufficiently confidently kills the current queen and takes over her role. *Chthonolasius* robots are very nicely colored, they are orange with a slight admixture of brown.
